## About Company

JB Modelarija Blažeka has been doing business for more than thirty years and is a true family company.

From the company's very beginning, its main strategy has been to focus on the best quality of the models.

While producing the most complex models, which can be made of wood, metal, plastic and styrofoam, the most modern CNC machines are used in order to radically shorten the production time, and models are produced directly from a 3D geometric model.

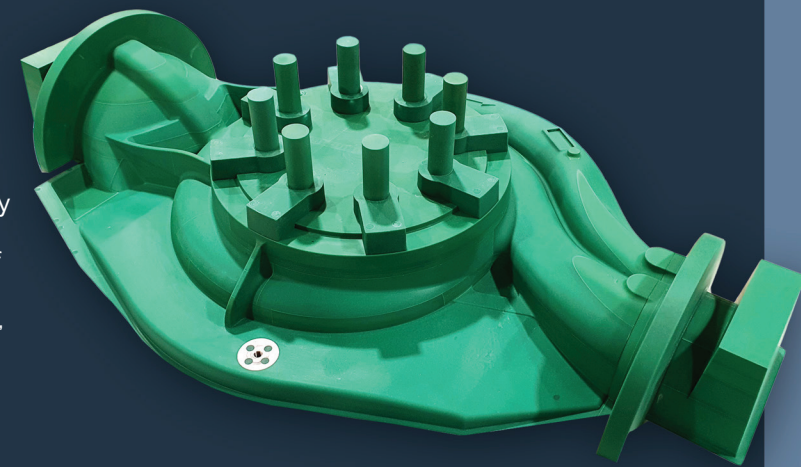

The company owns top quality technology, from three-axial to five- axial machines and we use only top quality materials (beech and birch plywood, epoxy and polyurethan resin SIKA/AXSON/RAMPF, aluminium, steel) and are able to carry out a precise production of even the most complex models directly from a 3D geometric model, at acceptable prices and in the shortest possible time.

An excellent coordination of work between departments, team work, employees' flexibility and creative thinking within a model-development department are all responsible for the present-day recognition of our company on the market.

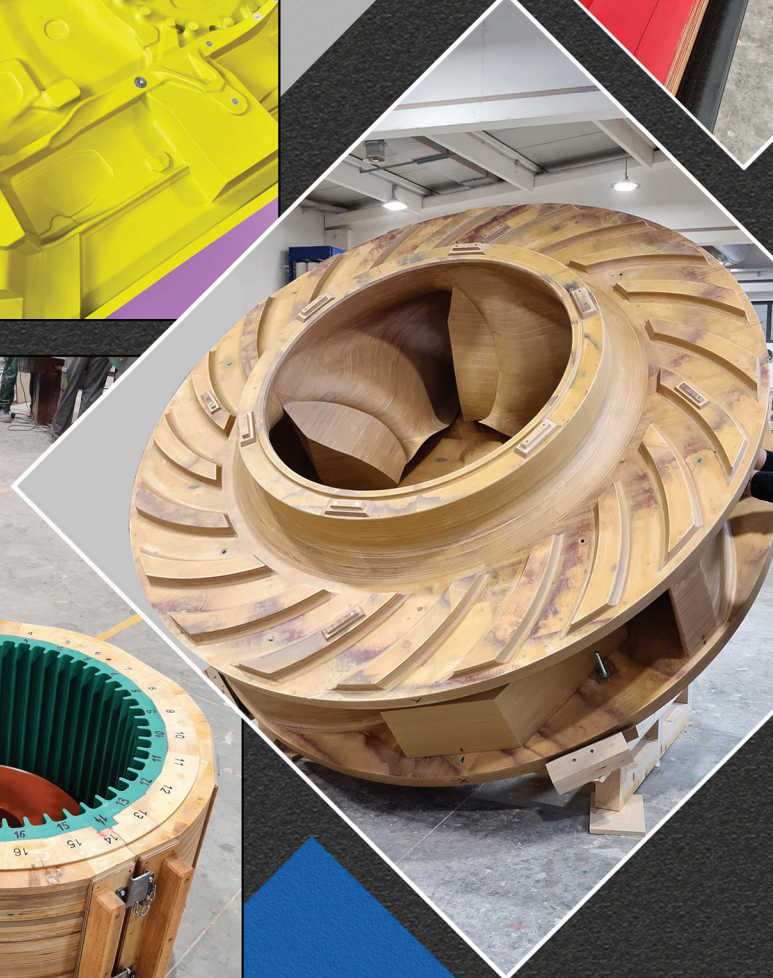

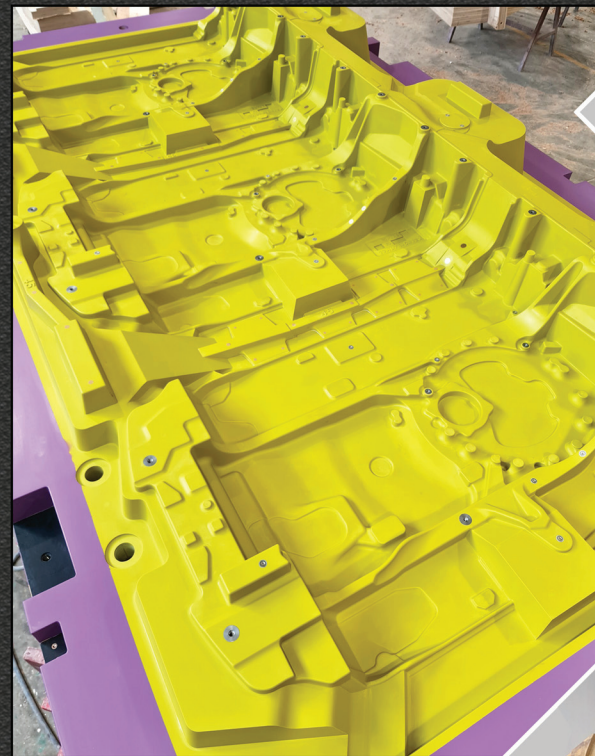

Production of all kind of tools for hand molding and automatic molding (Disamatic, HWS or any other auto. line) with complete assembly of foundry specific tools (raisers, gating system, closures and other spec. request)

Today, the company employs 75 employees who are focused on their work and are positioned at work stations which best suit their knowledge, skills and competencies.

This way, employees contribute to organisational success of the company and its sustainable competitive advantage.
